

# Exception Handling

Seng Yeung

Group 4

# Exception Handling

- A signal that tells the user / programmer that something has gone wrong with the program
  - The error is looked up in an Interrupt Vector Table (IVT) to determine what error it is
  - OS creates the IVT so that the programmer doesn't have to
- 

# Exception Handling

- Currently, some have tried to create a faster exception handling.
  - Exception handling has been advised to be used rarely and only when necessary
  - However, faster exception handling would result in faster programs while covering the errors easily
-
